SQLDay 2024

Poll question

**What do you prefer to use
when deploying Azure
Data Factory? (Choose 2)**

My response

ADFTools

PowerShell in Azure DevOps

34 %

Azure DevOps task

30 %

ARM Templates

21 %

ADFTools

13 %

Powered by Whova

- Azure Data Factory – DEPLOYMENT only
- Two (three?) methods of ADF deployment
- How these methods work
- Differences
- npm module from Microsoft – now you can fully automate CI (build)
- #adftools – make your life easier!

Slides available:

<https://azureplayer.net/slides>

Deployment (1): Microsoft's method (ARM Template)

Deployment (2): Directly from code method

Who use what?

Kamil Nowinski
@NowinskiK

My dear [#sqlfamily](#) [#azurefamily](#) members. How do you deploy your [@AzDataFactory](#) from a code repo?
[#devops](#) [#cicd](#)

ARM Template from “adf_publish” branch

- Faster, “incremental”
- Appears in „Deployments” for Resource Group
- Parametrize elements exposed within the ARM Template Parameter *
- Full ADF (all artefacts) can be deploy only
- Restriction of 256 parameters
- ~~Limitation to one publish branch only (adf_publish)~~
- ~~Manual “Publish” step~~
- Not user-friendly npm library
- Requires adding “package” file to a repo

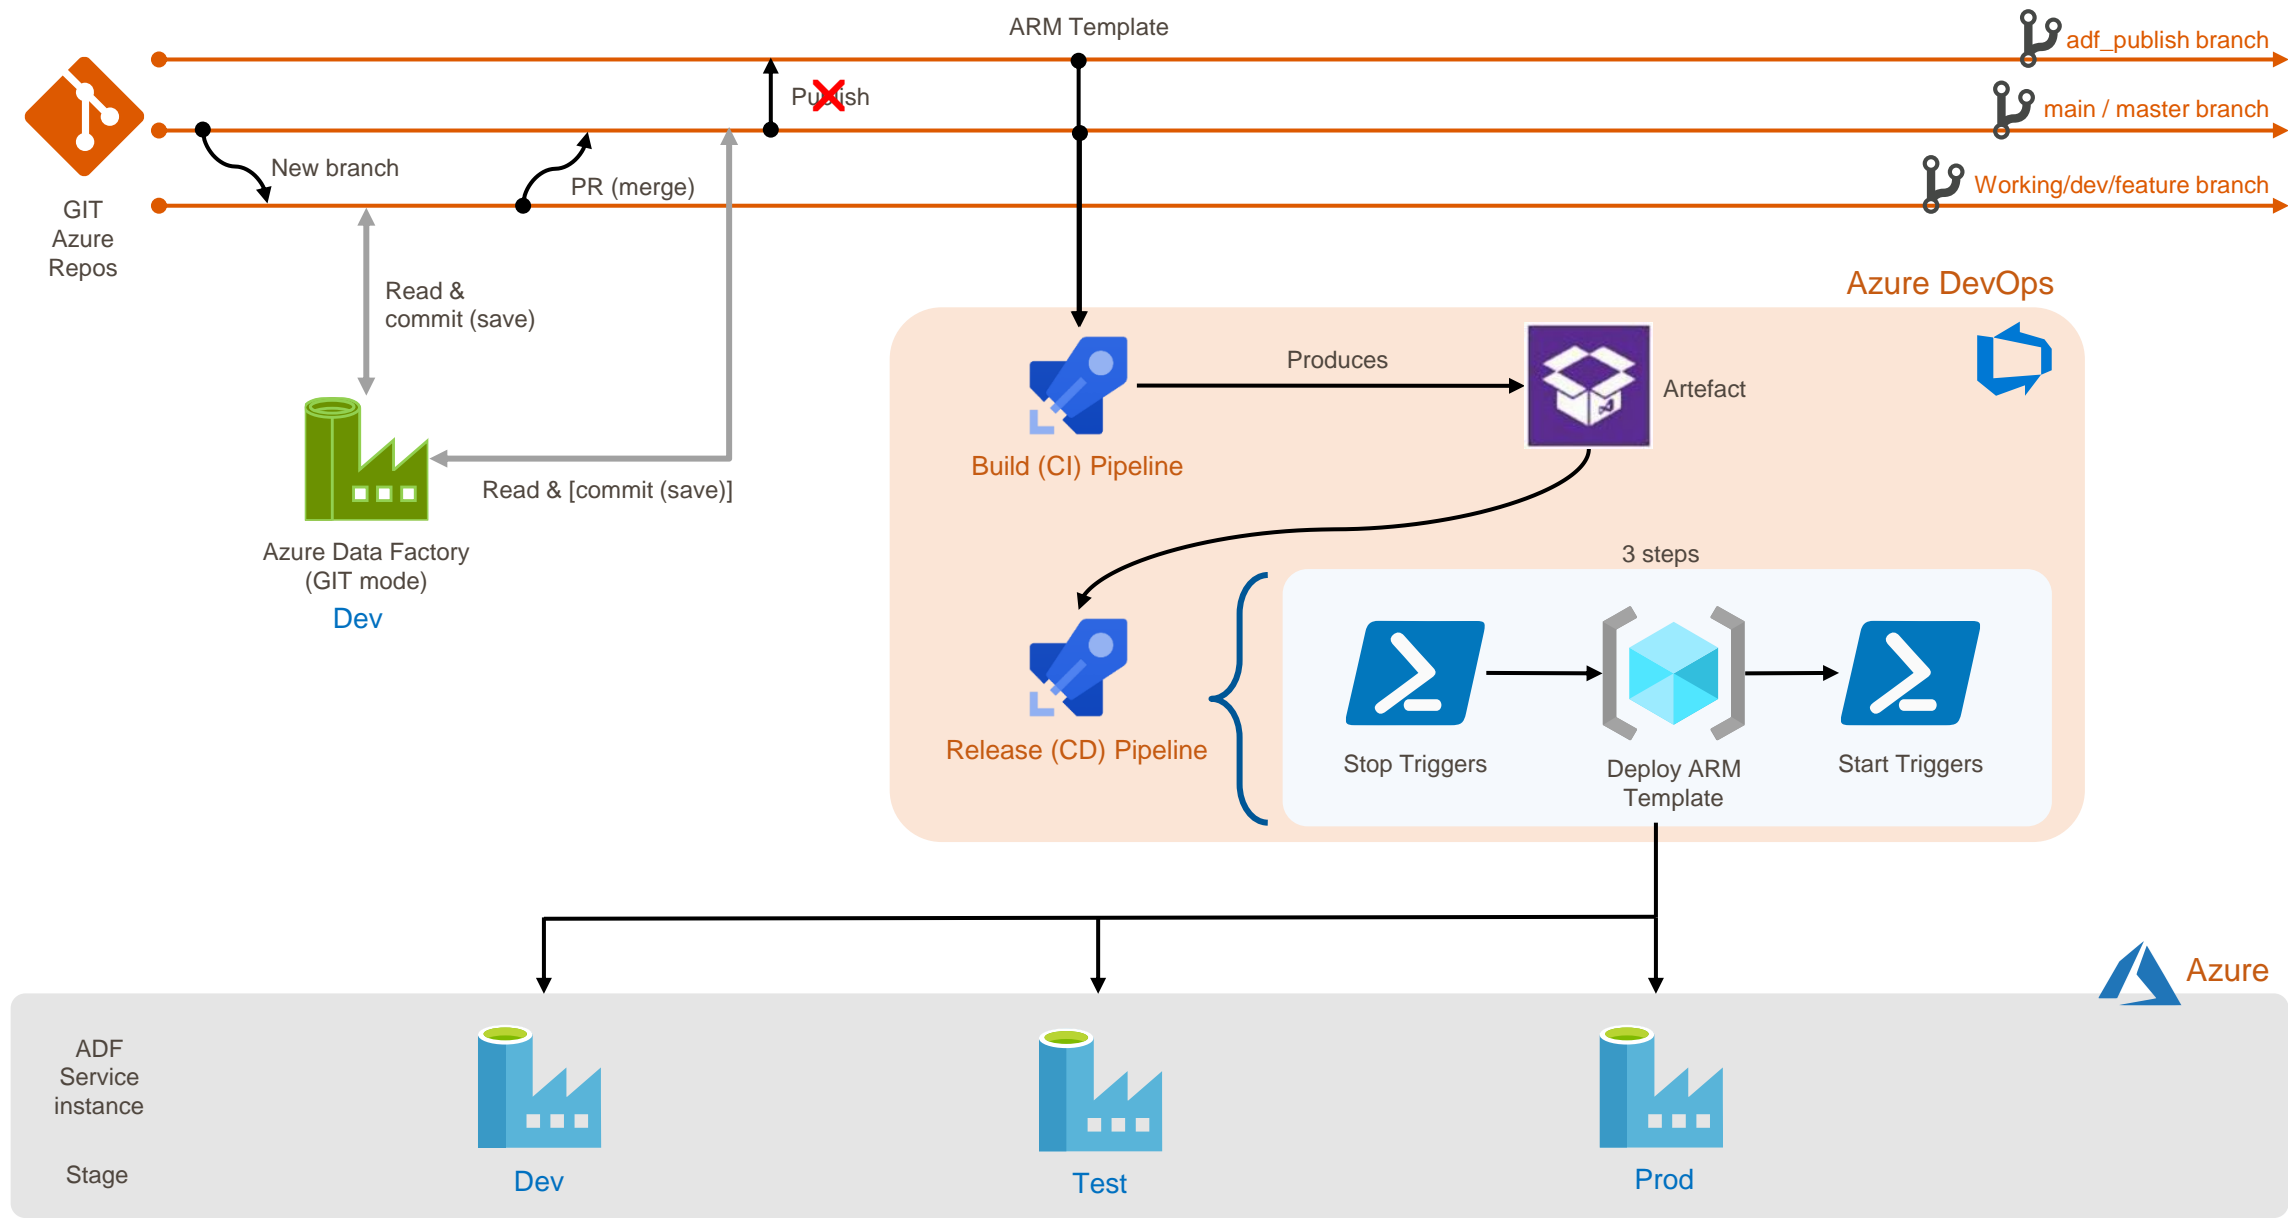

Rest-Api/PowerShell script from code (JSON objects)

- ~~Slower~~ (no longer due to incremental deployment)
- Doesn’t appear in „Deployments” for Resource Group
- Parameterize any artefact of the Data Factory
- Selectively deploy a subset of artefacts
- Eliminates an enforcement to use only one (adf_publish) branch if company’s branches policy is much complex

Since 2021

Automated publishing via CI/CD within npm & ARM Template

DEMO

... in a minute; a question first...

What do you prefer?

DEMO #1

ARM Template deployment

#adftools

Two tools:

PowerShell module (azure.datafactory.tools)

Azure DevOps extension (3 tasks)

<https://azureplayer.net/adftools/>

PowerShell Module

`azure.datafactory.tools`

- Fully written in PowerShell, compatible with 5.1
- Uses Microsoft's PS module (Az.DataFactory) for management of ADF objects
- Available in [PowerShell gallery](#)
- **Publish-AdfV2FromJson** function - capabilities:
 - Creation of Azure Data Factory, if not exist (option)
 - Deployment of all type of objects: pipelines, datasets, linked services, data flows & power query, triggers, integration runtimes, Managed VNET
 - Copes with dependencies (multiple levels) between objects when deploying (no more worrying about object names)
 - Build-in mechanism to replace the properties with the indicated values (CSV file)
 - Stop/start triggers (option)
 - Dropping objects when not exist in the source (code) (option)
 - Selective deployment: Filtering (include or exclude) objects to be deployed by name and/or type
 - Publish options allow you to control:
 - Whether stop and restarting triggers
 - Whether delete or not objects not in the source
 - Whether create or not a new instance of ADF if it not exist
 - **Incremental Deployment (new!)**
 - Generates mermaid dependencies diagram

DEMO #2

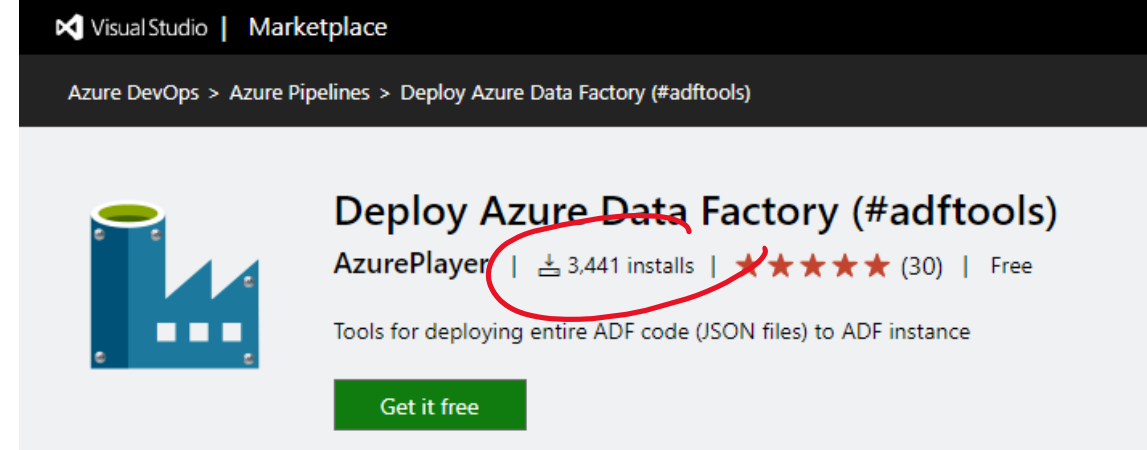

Deployment with PowerShell

Azure DevOps Extension

Azure DevOps: Custom Tasks

Key concept:

- Free & Open-Source
- One task for everything when it comes to the publishing of ADF
- Basically, it is another (UI) layer on top of „azure.datafactory.tools“ module
- Public Release (GA) since 23/12/2020
- Extension contains 3 tasks that cover full deployment life-cycle for ADF

[Deploy Azure Data Factory](#)

Any ideas or questions? Leave it here:

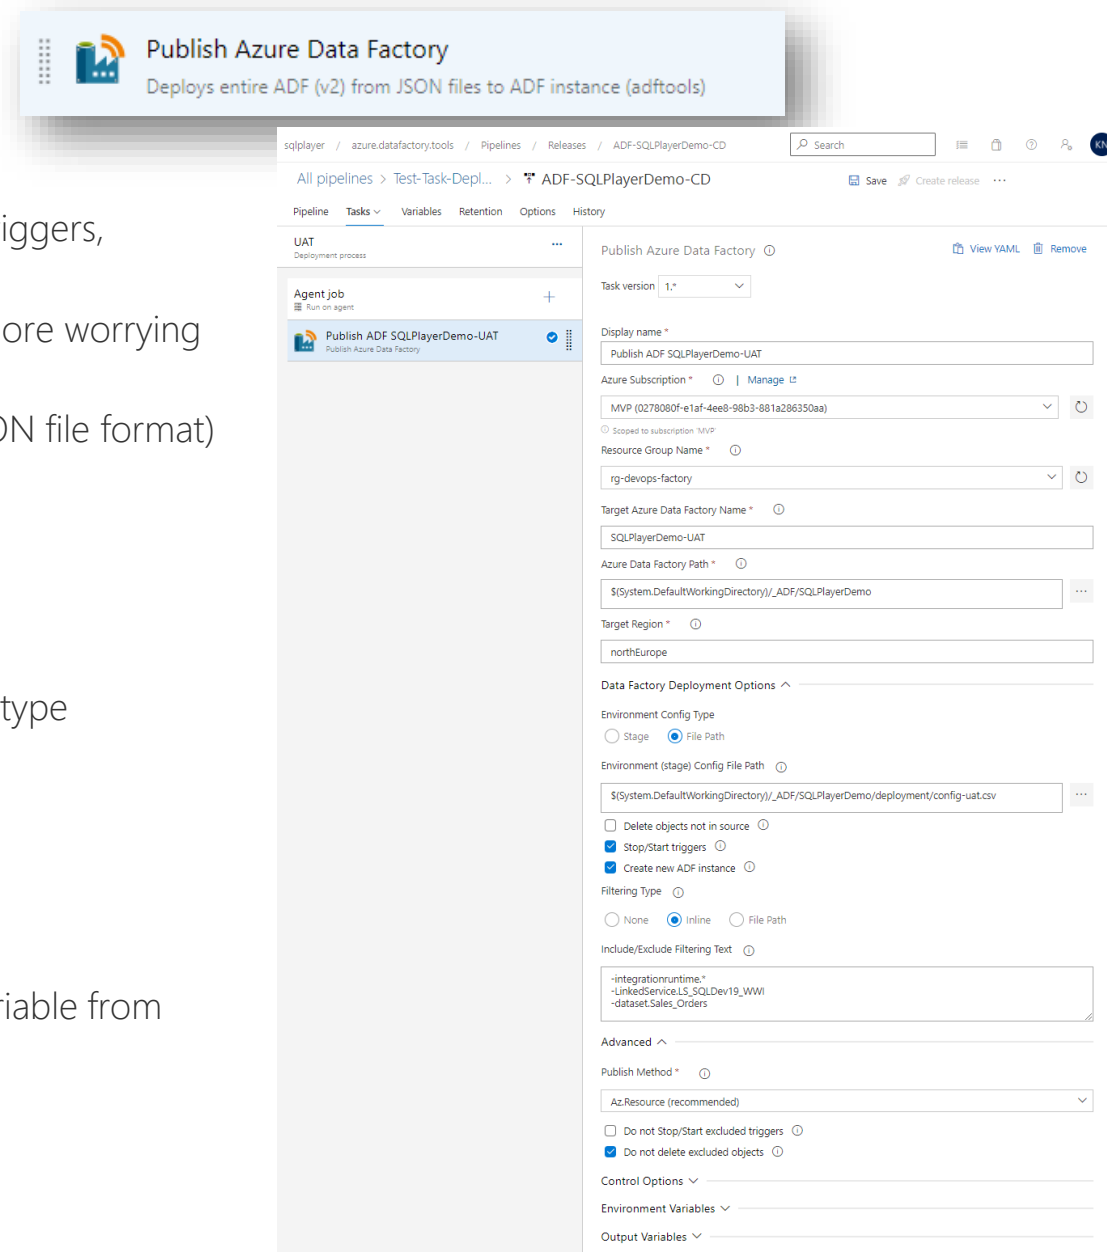

<https://github.com/Azure-Player/azure.datafactory.tools/issues>

Task in Azure DevOps: Publish ADF (CD)

Key capabilities:

- Creation of Azure Data Factory, if not exist (option)
- Deployment of all type of objects: pipelines, datasets, linked services, data flows, triggers, integration runtimes, Managed Virtual Network, Managed Private Endpoint
- Copes with dependencies (multiple levels) between objects when deploying (no more worrying about object names)
- Build-in mechanism to replace the properties with the indicated values (CSV & JSON file format)
- Update, add or remove any property of ADF artefact
- Selective deployment declared in-line or by pointed file
- Stop/start triggers (option)
- Dropping objects when not exist in the source (code) (option)
- Filtering (include or exclude) objects to be deployed by name and/or type and/or type
- Filtering supports wildcards
- Publish options allow you to control:
 - Whether stop and restarting triggers
 - Whether delete or not objects not in the source
 - Whether create or not a new instance of ADF if it not exist
- Tokenisation in config file allows replace any value by Environment Variable or Variable from DevOps Pipeline
- Global Parameters
- Incremental Deployment

Selective deployment with PowerShell module

You can select objects by objects types & name using include or exclude option.

Allows to select the objects by belonging to a folder (picture)

Name can be **wildcarded**, so all such variants are possible:

```
trigger.*  
dataset.DS_*  
*.PL_*  
linkedService.???KeyVault*  
pipeline.ScdType[123]  
*.*@Team1  
managedVirtualNetwork*.*  
*managedPrivateEndpoint.*
```

DS_Src_MovieCsv	

DEMO #3

Deployment with Azure DevOps

Bonus capabilities

New task in Azure DevOps: Build ADF (CI)

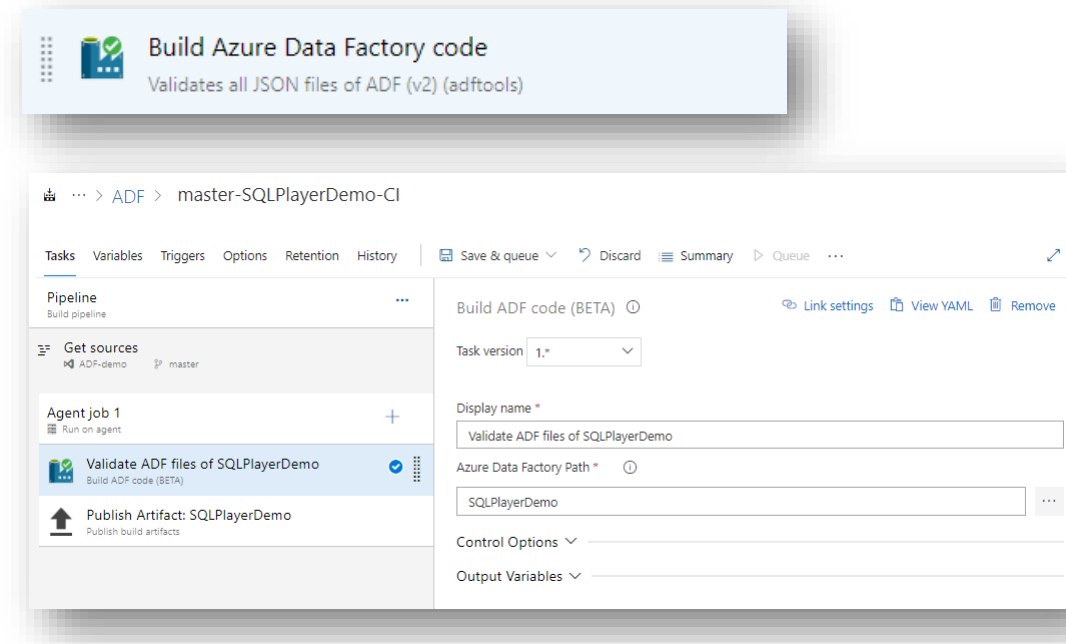

The task has 2 modes:

- **Build only**

- Reads all files and validates its json format
- Checks whether all dependant objects exist
- Checks whether file name equals object name

- **Validate & Export ARM Template**

- uses [ADFUtilities NPM package](#) provided by Microsoft
- Counterpart of **Validate all** and **Export ARM Template** in ADF UI

New task in Azure DevOps: Test Connection

- Run „Test connection“ for a Linked Service
- Smoke tests of (some) Linked Services
- In preview
